### **About Gevo**

Gevo is commercializing the next generation of jet fuel, gasoline and diesel fuel with the potential to achieve zero carbon emissions and address the market need of reducing greenhouse gas emissions with sustainable alternatives. Gevo uses low-carbon renewable resource-based carbohydrates as raw materials, and is in an advanced state of developing renewable electricity and renewable natural gas for use in production processes. As a result, Gevo is able to produce low-carbon fuels with substantially reduced carbon intensity (as measured by the level of greenhouse gas emissions compared to standard petroleum fossil-based fuels across their lifecycle). Gevo's products perform as well or better than traditional fossil-based fuels in infrastructure and engines, but with substantially reduced greenhouse gas emissions. In addition to addressing the environmental problems of fossil-based carbon fuels, Gevo's technology also enables certain plastics, such as polyester, to be made with more sustainable

ingredients. Gevo's ability to penetrate the growing low-carbon fuels market depends on the price of oil and the value of abating carbon emissions that would otherwise increase greenhouse gas emissions. Gevo believes that its proven, patented, technology that enables the use of a variety of low-carbon sustainable feedstocks to produce price-competitive, low carbon products, such as jet fuel, gasoline components like isooctane and isobutanol and diesel fuel, yields the potential to generate project and corporate returns that justify the build-out of a multi-billion dollar business.
